                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        FUNCTION: Plays a key role in the control of the eukaryotic cell cycle. It is required in higher cells for entry into S-phase and mitosis. Component of the kinase complex that phosphorylates the repetitive C-terminus of RNA polymerase II. Catalytic component (MPF (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 mature oocytes (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           preliminary data.

New crystal of protein kinase B beta, useful for activating protein kinases, e.g. AGC kinases, comprises three-dimensional atomic coordinates or a tetragonal space group.

The present invention describes a crystal of protein kinase B beta (PKBbeta) comprising (I), where (I) comprises: (a) a tetragonal space

CC independent antibody (I) that recognises several peptides or proteins (CC within the genome that contain motifs. The method is useful for: (1) CC identifying an unknown substrate of an enzyme, which involves generating CC at least one (I) which recognizes a motif common to several substrate of the enzyme with a genome; (2) detecting the modification state of a CC target substrate that contains a motif common to several substrates of an CC enzyme within a genome; (3) screening a drug for the inhibition or CC activation of enzyme activity on at least one substrate that contains a CC motif common to several substrates of the enzyme within a genome; (4) CC identifying an enzyme which modifies a known substrate that contains a CC motif common to several substrates of the enzyme within a genome; (5) CC profiling protein levels or post-translation modifications in a cell or tissue on a genome wide scale; (6) profiling drug-induced changes in CC genome wide scale. The motif is selected from single phosphothreonine, a contain single phosphoserine, a single phosphotyrosine, a single phosphotyrosine, a single phosphotyrosine, and comprises all or part of kinase consensus consensus sequence of a peptide used in the creation of a motif-specific, context-contendent antibody used in the creation of a motif-specific, context-contendent antibody used in the creation of a motif-specific, context-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention describes a method of producing a motif-specific, independent antibody (I) that recognises several peptides or provinthin the genome that contain motifs. The method is useful for

CC described: (1) selecting or designing (M2) a compound for modulating the CC activity of a hydrophobic pocket (PIF binding pocket)-containing the CC hydrophobic pocket of human PDK1 that is defined by residues including CC Lys115, Ile118, Ile119, Vall24, Vall27 and/or Leu155 of full-length human CC equivalent to the phosphate binding pocket in the position CC equivalent to the phosphate binding pocket of human PDK1 that is defined by residues including Lys76, Arg131, Thr148 and/or Gln150; (2) assessing CC (M3) the activation state of a structure for a protein kinase; (3) a CC mutated protein kinase (II); (4) a polynucleotide (II) encoding (I); (5) a CC modulates the protein kinase activity of a protein kinase (e.g., PDK1); (7) an antibody (IV) reactive with PDK1 or (I) but not with the protein compound (V) identified or identifiable by (M1) or twith the protein kinase (B) a CC compound (V) identified or identifiable by (M1) or (M3); (9) use of (V), (I) in medicine; (10) use of (V), (I), (II) for the manufacture of a medicament for the treatment of a patient in need of modulation of CC signalling by a protein kinase as defined, for example PDK1, SGK, PKB, or PDK1/PDK2/SGK/PKB/p70 S6 kinase/PRK2/PKC signalling pathway and/or CC protein kinase. (V) is useful for modulating the ability of protein CC wasorropic and anorectic activities, and can be used as a modulator of CC protein kinase. (V) is useful for modulating the ability of protein CC cordinates an arroyleded in the specification are useful for ceasing e.g., the co-cordinates as royaleded in the specification are useful for designing the activity of protein kinase. The protein are useful for designing the solution of cordinates as a royaleded in the specification are useful for designing the solution of cordinates as a royaleded in the specification are useful for designing the solution of cordinates as a royaleded in the specification are useful for designing the condition of cordinates as a cordinate as a cordinate as a cordinate as a cordinate as a cord ordinates as provided in the specification are useful for designing reagent useful in drug designing assays or characterisation of protein kinase activity or regulation. (V) capable of producing the activity of PKC, e.g., PKC beta, PRK1 or PK2, PDK1, PKB, SGK or p70 S6 kinase, is useful in treating cancer. (V) capable of increasing the activity of PDK1, PKB, SGK or p70 S6 kinase is useful in treating diabetes or obesity or may be useful in inhibiting apoptosis, thus useful in treating diseases in which apoptosis is involved e.g., mechanical (including heat) tissue injury or ischaemia disease such as stroke, myocardial infarction and neural injury. (V) is useful as an antifungal agent. The present sequence is used in the exemplification of the present invention.

WP1; 2000.
Selecting/designing compound for mount of the second of the s for modulating activity of phosphoinositide y using molecular modelling to select/design ct with protein kinase catalytic domain.

Page 16; 383pp; English.

Compound (N) is electing a compound that is predicted to interact with the protein (N) as electing a compound that is cativity of a hydrophobic pocket (PIP binding pocket) compound for modulating the cativity of a hydrophobic pocket in the position equivalent to the protein (N) and further having a phosphate binding pocket in the position equivalent to the phosphate binding pocket in the position of equivalent to the phosphate binding pocket in the position of equivalent to the phosphate binding pocket of human PRI that is defined by residues including Lys76, Argill, Thil4 and/or Gin150; (2) assessing the protein kinase (I); (4) a polynucleotide (II) encoding (I); assessing the protein kinase (I); (6) identifying (M4) a compound that modulates the protein kinase activity of a protein kinase (e.g., PRI); (C) (7) an antibody reactive with the phosphate binding pocket of PRI (I); (a) antibody reactive with the phosphate binding pocket of PRI (I); (b) antibody reactive with the phosphate binding pocket of PRI (I); (l) in medicine; (l) use of (V), (II); (l) in medicine; (l) use of (V), (II); (II); (II) for the manifacture of a patient in need of modulation of protein kinase as defined, for example PRI, ScK, PRB, or PRI, PRI, ScK, PRB, PRO (VI); as useful for modulating pocket of PRI, (II); and antibody reactive with PRI (VI); (II) for the manifacture of a patient in need of modulation of protein kinase as defined, for example PRI, ScK, PRB, or PRI, PRI, ScK, PRB, PRO (VI); and protein kinase as defined, for example PRI, ScK, PRB, or PRI, PRI, ScK, PRB, ScK, PRB, or PRI, PRI, ScK, PRB, ScK, PRB, or PRI, PRI, ScK, PRB, ScK, PR protein kinase he present invention describes a method (M1) for selecting or designing compound for modulating the activity of phosphoinositide dependent or design a compound that 1 (PDK1) comprising using molecular modelling is predicted to interact with the

```
CC kinase domain of [1], and associated activation loop which may be propertied [8] under conditions conducive to allow kinase activity to be CC detected in absence of [7]; and [c] detecting effect of [7] on kinase activity. Also described: [1] a truncated AGC kinase polypeptide [1] or kinase CC use in [M1]; [2] a mutated AGC kinase [1]] comprising a mutation in a CC kinase domain and/or activation loop in order to reduce binding ability CC identified by [M1] for use in [M1]; [3] a compound/agent [1]) comprising the sequence F/Y-X-X-F/Y-F/T-F in which the S/T residue is CC phosphorylated; and [5] a peptide comprising the sequence F/Y-X-X-F/Y-F/D [7]. The sequence F/Y-X-X-F/Y-F/T-F in which the S/T residue is CC phosphorylated; and [5] a peptide comprising the sequence F/Y-X-X-F/Y-F/D [7]. The manufacture of a medicament for use in the S/T residue is CC erivities, and can be used as an AGC kinase activity modulator. The CC activity, such as an activator or inhibitor of AGC protein kinase activity. Such as an activator or inhibitor of AGC protein kinase activity. Such as an activator or inhibitor of AGC protein kinase activity. Such as an activator or inhibitor of AGC protein kinase activity is useful or treating diseases associated CC with abnormal cell proliferation or apoptosis, such as cancer, or CC artivity is useful or treating diseases associated CC with abnormal cell proliferation or apoptosis, such as cancer, or inhibiting apoptosis. The phosphorylated peptide is useful for modulating for modulating AGC kinase activity, and for designing new composition of the present sequence represents a protein kinase B CC capable of inhibiting AGC kinase activity, and for designing new composition of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present sequence represents a sequence which is phosphorylated by protein kinase PDKI. The specification describes a screening method to condition the specification describes a screening method to condition the specification describes a screening method to compound which modulates the activity of protein kinases from configurates (sing host yeast cells. The method is used to identify a compound which modulates (inhibits) the activity of a protein kinase. While or Pkh2 phosphorylate and activate Ypk1, Yrk2, human serum and configurate (PKH1) is used to phosphorylate and activate Ypk1, Yrk2, human serum and configurate Ypk1 and Yrk2 or SGK but not PKBalpha or CC (FKBalpha). 3-phosphoinositide-dependent protein kinase-1 (PDK1) is used to phosphorylate and activate Ypk1 and Yrk2 or SGK but not PKBalpha or CC (FMBalpha). 3-phosphoinositide-dependent protein kinase-1 (PDK1) is used to phosphorylate and activate Ypk1 and Yrk2 or SGK but not PKBalpha or CC (FMBalpha). 3-phosphoinositide-dependent protein kinase-1 (PDK1) is used to phosphorylate and activate Ypk1 and Yrk2 or SGK but not PKBalpha or CC (FMBalpha). 3-phosphoinositide-dependent protein kinase-1 (PDK1) is used to phosphorylate activate Ypk1 or treat cancer. To treat cancer, the CC (FMBalpha). 3-phosphoinositide-dependent protein kinase-1 (PDK1) the used to treat cancer, the CC (FMBalpha). 3-phosphoinositide-dependent protein kinase-1 (PDK1) is used to treat cancer. To treat cancer, the CC (FMBalpha). 3-phosphoinositide-dependent protein kinase-1 (PDK1) is used to treat cancer. To treat cancer, the CC (FMBalpha). 3-phosphoinositide-dependent protein kinase-1 (PDK1) is used to treat cancer. To treat cancer, the CC (FMBalpha). 3-phosphoinositide-dependent protein kinase-1 (PDK1) is used to treat cancer. To treat cancer, the CC (FMBalpha). 3-phosphoinositide-dependent protein kinase. To treat cancer, the CC (FMBalpha). 3-phosphoinositide-dependent protein kinase. To treat cancer the protein kinase. To treat cancer the protein kinase. To treat cancer the pro
New protein kinase related to p70S6K pathway enzymes with threonine 389 replaced - by acidic amino acid, has constitutive activity, used to identify potential antiproliferative and immunosuppressant agents, also new dominant negative mutant of this enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 31-OCT-1996;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      07-MAY-1998

This invention relates to a new protein kinase, structurary residue kinase of the p7056K signalling pathway. It has the S or T residue homologous to T389 in p7056K replaced by an acidic amino acid which homologous to to to activity. The new protein kinases are used to to the protein kinases are used to the protein ki
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               kinase of the p7056K signalling pathway. It has the SorT residue homologous to T389 in p7056K replaced by an acidic amino acid which confers constitutive activity. The new protein kinases are used to identify p7056K kinases responsible for regulation (especially by phosphorylation) of the p7056K-related kinase and its direct activation through T229, also to screen for compounds that inhibit kinase activity in the p7056K pathway. The protein kinases of the p7056K signalling pathway are used to define this signalling pathway and to block upstream kinases. Mutation of T389 with an acidic amino acid produces a severalfold increase in basal kinase activity while retaining susceptibility to activation. Use of the new protein kinases in assays means that the signal pathway can be kept active without addition of exogenous mitogens or other activators. The present sequence represents an internal fragment of RAC-PK/Akt alpha containing an S residue at position 6 homologous to
                                                                                                                                                                                                                                                                                                                              Disclosure; Page 5;

       the same. The assay if useful for easily, rapidly, accurately and stably determining the activity of purified or unpurified protein kinase IIKI without using a radioactive isotope. A peptide for protein kinase IIKI assay is characterised by having the amino acid sequence of SEQ ID NO: 13, wherein the peptide is selected from the amino acid sequences of SEQ ID NO: 1 to SEQ ID NO: 8; and the peptide is labeled with fluorescence. A method for determining activity of non-radioactive protein kinase IIKI comprises the steps of: labeling a peptide for protein kinase IIKI assay with fluorescence; reacting the fluorescence-labeled peptide with protein kinase IIKI; subjecting the reacted fluorescence-labeled peptide to electrophoresis to separate phosphorylated and unphosphorylated peptides:
                                                                                                                                                                                                                                                                                                                                                                        Chun
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           phosphorylation) of the p70S6K-related kinase and its direct activation through T229, also to screen for compounds that inhibit kinase activity in the p70S6K pathway. The protein kinases of the p70S6K signalling pathway are used to define this signalling pathway and to block upstream kinases. Mutation of T389 with an acidic amino acid produces a several-fold increase in basal kinase activity while retaining susceptibility to

CC of phosphoinositide-dependent protein kinase 1 (PDK1), by exposing it to CC an interacting polypeptide. Included in the invention are a preparation CC comprising PDK1 and an interacting polypeptide, PDK1 with altered CC specificity is useful for phosphorylating a residue corresponding to the Ser/Thr residue of a substrate with the following peptide Phe/Tyr-Xaa-Xaa CC -Phe/Tyr-Ser/Thr-Phe/Tyr. Altered PDK1 is also used for phosphorylating protein kinase C related protein kinase 2 (PRK2). The compound identified CC by methods of the invention that are capable of altering the substrate EC specificity of PDK1 are useful for manufacturing a medicament for CC treating a patient who is in need of modulation of the insulin signalling CC pathway and/or PDK1, PDK2 or PRK2 signalling. A compound that is capable of reducing the activity (i.e. the PDK1 and/or the PDK2 activity) of PDK1 (CC may be useful in treating cancer. PDK1, e.g. via protein kinase B and/or CC SGK, may be capable of providing a survival signal that protects cells from apoptosis induced in a variety of ways. Reduction of the activity of PDK1 may promote apoptosis and may be useful in treating cancer. CC Conditions in which aiding apoptosis may be benefit may also include cof PDK1 may be useful in treating diabetes or obesity, or may be useful in treating diabetes or obesity, or may be useful in treating diabetes or obesity, or may be useful in treating diabetes or obesity, or may be useful in treating diabetes or obesity, or may be useful in treating diabetes or obesity, or may be useful in treating diabetes or obesity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       밁

                                                                                            The present invention relates to detecting addition or removal of a phosphate group to or from a substrate. The method involves contact luminescent peptide with a binding partner that binds specifically phosphorylated peptide without regard to the particular amino acid sequence of the peptide. The method is useful for detecting phosphorylation and dephosphorylation medifications of proteins, including kinases and phosphatases. The methods can be used to stud kinase activity of different receptors e.g. the insulin receptor an find agonists and antagonists of these receptors
                                                                                                                                                                                                                                                                    Assay for detecting phosphorylation and dephosphorylation modification proteins by contacting luminescence peptide with a binding partner and measuring change in luminescence polarization.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                damaging processes and in treating disease in which apoptosis is involved. Examples of the diseases include, mechanical (including heat) tissue injury or ischaemic disease, for example stroke and myocardial infarction, or neural injury. The present sequence represents a peptide used to raise phosph-specific antibodies against protein kinase B phosphorylated at Ser 473. The peptide is used in methods to show that PDK1 is responsible for the phosphorylation of PKB

                                                                                           which interact with proteins e.g. enzymes, receptors, or signaling proteins, in order to regulate the activity of the proteins. The method comprises: identifying a switch control ligand forming a part of the protein; identifying a switch control pocket forming a part of the protein and which interacts with the switch control ligand, where the ligand interacting in vivo with the pocket to regulate the conformation and biological activity of the protein so that the protein will assume a first conformation and a first biological activity upon the ligand-pocket interaction, and will assume a second, different conformation and a biological activity in the absence of the ligand-pocket interaction; and screening at least one of the samples against one or providing respective samples of the protein in the first and second conformations; and screening at least one of the samples against one or more candidate molecules by contacting the molecules and one sample, and identifying small molecules which bind with the protein at the region of the pocket in order to regulate the activity of the protein. The method is useful for modulating protein activity and for the identification of new pharmacological compounds and for treatment modalities. The present sequence is one such switch control ligand, which is specific to protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 31-DEC-2002;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Protein kinase B; PKB; substrate; glycogen metabolism; pancreatic cancer; regulator; protein synthesis; enzyme modulator; type II diabetes; insulin-stimulated crosstide kinase; breast cancer; ovarian cancer; therapy; RAC; protooncogene Akt.
                                                                                                                                                                                                                              equivalents for regulating glycogen metabolism and/or protein synthesis is the subject of the invention. This sequence can also be used in a method of the invention for identifying agents that modulate the activity of PKB. It can also be used to screen for modulators of enzymes that catalyse PKB phosphorylation. PKB (an insulin-stimulated crosstide kinase) and its analogues etc. are used to treat disease characterised by abnormal glycogen metabolism and/or protein synthesis, especially type II diabetes and cancer (specifically of breast, pancreas and ovary). The
                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents a C-terminal fragment of protein kinase B (PKB). PKB is also known as the protooncogene Ak, and RAC. This sequence was used as an epitope to produce PKB specific antibodies. The use of PKB, its analogues, isoforms, inhibitors, activators and/or functional
                                                                                                                  Sequence 12
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Use of protein kinase B for regulation of glycogen metabolism and protein synthesis - also peptide substrates for PKB and methods for screening for
                                                                                                                                                                           various screening methods are used to identify for treating these diseases

                                                                  Matches
                                                                                                                                                             The invention relates to a chimeric protein kinase having an inhibitor binding site comprising amino acid residues of a first protein kinase which bind an inhibitor and residues of a second protein kinase which do not bind the inhibitor. The chimeric protein kinase is useful for identifying inhibitor molecules capable of affecting the activity of first protein kinase, by preparing the chimeric protein kinase, growing a crystal of the chimeric protein kinase, solving the structure of crystal of chimeric protein kinase, using X-ray crystallography methods and using the structure to design inhibitor molecules capable of affecting the activity of the first protein kinase. The structure of the chimeric protein kinase is useful for the rational drug design of inhibitors of non-crystallisable protein kinase. The present sequence represents the amino acid sequence of a protein kinase region near the binding site for sulindac sulphide and PD98059
                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel chimeric protein kinase for identifying inhibitor molecules, has inhibitor binding site of first protein kinase which bind to inhibitor and amino acids of second protein kinase which do not bind to inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Protein kinase; kinase; enzyme; rational drug design; non-crystallisable; sulindac sulphide; PD98059.
